

## 20240416 Chapter 3 details

Prerequisites to begin working on a project:

- (0) - Starts with the Problem Definition (what details are desired)
- (a) List of requirements (gathered via user stories)
- (b) Architecture of the Problem

*CONCEPT*: The earlier a defect occurs in the process and later it is detected, the more costly the problem

## UML Usage (4/16 and 4/18)

→ Only class diagrams will be used for project

- Organize class hierarchy
- - sign is private. + sign is public.
- Generalization relationship - inheritance - triangle to base class
- Association relationship - aggregation - stored as a variable in another class - solid line
  - Full or empty diamond included for composition versus aggregation
  - Composition is most typical; aggregation is different (more like working together)
- Object type is not relevant in UML (pointer or not) - only shows up within class card
- Book+Pages are composition; not a book without pages/cover
- Dependency (third relationship)
  - Example: function in class A uses class B in a function
- Place Abstract Classes with italic class name in UML
- Entity versus Boundary versus Control
  - MVC design - Model View Controller
  - Model: Entity
  - View: Boundary (user interface)
  - Controller: Control that manipulates interaction between model and view
  - Separation of UI and model code allows for simple classes
- 

## 20240417 Discussion : GDB and Valgrind

g++ filename.ext -g -o newfile.exe

(gdb) break ;line-number;

(gdb) print ;variablename;

(gdb) step - goes into the function code

(gdb) next - runs function but does not enter function code

(gdb) continue - runs to end

(gdb) info breakpoints

(gdb) del break 1

(gdb) quit

exiting the debugger also removes breakpoints

Valgrind:

Memory debugging via memcheck g++ -g -O0 \*.cpp -o newfile.exe

valgrind --leak-check=full filename.exe

-track-origins=yes gives locations of memory leaks

*additional valgrind details:*

valgrind ./filename.exe (runs valgrind and gives list of issues)

Commands show up in the output for further commands

### **Unit Testing: 20240423**

- Manufacturer to Quality relationships
- Unit Tests should be on github pull requests
- Protects your code from others' mistakes
- Write Failing Test - Make Code Work - Eliminate Redundancy
- Unit Testing Versus Integration Testing
  - Unit Testing: SUT (System Under Testing)
    - Arrange: Open part of app to test
    - Act: apply stimulus to part of app
    - Assert: observe resulting behavior and verify results
  - Google Test: gtest primer - assertions
  - Assert Versus Expect true/equal/etc.
    - Assert fails mid-function if incorrect state
    - Expect continues to end of function even if state fails
  - Test cases should not throw, but do more expect/assert cases against values like nullptr
  - Assert is best used when a test after may seg-fault
  - EXPECT\_NEAR will take error margin as third argument
  - Can use stringstream to store integer values to compare to specific decimal places
    - Can use output streams as an argument for the location of an output
  -
