20240416 Chapter 3 details

Prerequisites to begin working on a project:

- (0) Starts with the Problem Definition (what details are desired)
- (a) List of requirements (gathered via user stories)
- (b) Architecture of the Problem

CONCEPT: The earlier a defect occurs in the process and later it is detected, the more costly the problem

UML Usage (4/16 and 4/18)

- → Only class diagrams will be used for project
 - Organize class hierarchy
 - - sign is private. + sign is public.
 - Generalization relationship inheritance triangle to base class
 - Association relationship aggregation stored as a variable in another class solid line
 - Full or empty diamond included for composition versus aggregation
 - Composition is most typical; aggregation is different (more like working together)
 - Object type is not relevant in UML (pointer or not) only shows up within class card
 - Book+Pages are composition; not a book without pages/cover
 - Dependency (third relationship)
 - Example: function in class A uses class B in a function
 - Place Abstract Classes with italic class name in UML
 - Entity versus Boundary versus Control
 - MVC design Model View Controller
 - Model: Entity
 - View: Boundary (user interface)
 - Controller: Control that manipulates interaction between model and view
 - Separation of UI and model code allows for simple classes

•

20240417 Discussion: GDB and Valgrind

g++ filename.ext -g -o newfile.exe

- (gdb) break iline-number.
- (gdb) print ¡variablename;
- (gdb) step goes into the function code
- (gdb) next runs function but does not enter function code
- (gdp) continue runs to end
- (gdb) info breakpoints
- (gdb) del break 1
- (gdb) quit

exiting the debugger also removes breakpoints

Valgrind:

Memory debugging via memcheck g++-g-O0*.cpp -o newfile.exe valgrind -leak-check=full filename.exe

-track-origins=yes gives locations of memory leaks

 $additional\ valgrind\ details:$

valgrind ./filename.exe (runs valgrind and gives list of issues)

Commands show up in the output for further commands

Unit Testing: 20240423

- Manufacturer to Quality relationships
- Unit Tests should be on github pull requests
- Protects your code from others' mistakes
- Write Failing Test Make Code Work Eliminate Redundancy
- Unit Testing Versus Integration Tesing
 - Unit Testing: SUT (System Under Testing)
 - Arrange: Open part of app to test
 - Act: apply stimulus to part of app
 - Assert: observe resulting behavior and verify results
 - Google Test: gtest primer assertions
 - Assert Versus Expect true/equal/etc.
 - Assert fails mid-function if incorrect state
 - Expect continues to end of function even if state fails
 - Test cases should not throw, but do more expect/assert cases against values like nullptr
 - Assert is best used when a test after may seg-fault
